ELECTRIC POTEMCIAL AND CAPACITAMCE

Electric potential

Jump Clone in moving a unit positive change from injusty to that point against the electrostatic forces.

Electric potential = work done change

SI unit of electric potential is vott.

Potential difference

from one point to other inside the electric field of other change

Potential due to a boint charge

Charge from injuity to point A which is imide the electric field of main charge a

Now fune experienced by go:- + = 1 41180 212

Now,

Small work done to move the charge towards the charge of

$$dw = f \cdot dm = f \cdot dm \cdot (usi \theta 0)$$
 $dw = -f \cdot dm$

Then total work done on change go to bring it to point P.

$$\int_{0}^{\infty} dw = \int_{0}^{\infty} -\int_{0}^{\infty} \frac{1}{4\pi}$$

$$\left[\omega \right]_{0}^{\omega} z - \int_{-\frac{1}{4\pi\epsilon}}^{\frac{1}{4\pi\epsilon}} \frac{\alpha_{90}}{n^{2}} dn = -\frac{1}{4\pi\epsilon} \frac{\alpha_{90}}{\sqrt{\pi\epsilon}} \int_{-\frac{1}{2}+1}^{\frac{1}{4\pi\epsilon}} \frac{\alpha_{90}}{\sqrt{\pi\epsilon}} \int_{-\frac{1}{2$$

$$\omega = -\frac{\omega_{q_0}}{4\pi\xi} \left(\frac{\varkappa^{-1}}{-1} \right)^{\frac{1}{2}} = \frac{\omega_{q_0}}{4\pi\xi} \left(\varkappa^{-1} \right)^{\frac{1}{2}}$$

$$\omega = \frac{Qq_0}{4\pi\xi} \left(\frac{1}{2} \right)_{\infty}^{R} = \frac{Qq_0}{4\pi\xi} \left(\frac{1}{2} - \frac{1}{2} \right)$$

Now we know

Potential = work = w

Charge 90

From en ()
$$V = \frac{1}{4\pi\epsilon} \frac{\alpha_{90}}{9} \times \frac{1}{9}$$

$$V = \frac{1}{4\pi\epsilon} \frac{\alpha_{90}}{9} \times \frac{1}{9}$$

here $V \propto \frac{1}{4}$

Potential due to a dipute at axial Point

det V+q = Potential at A due to +q unange V-q = Potential at A due to -q charge

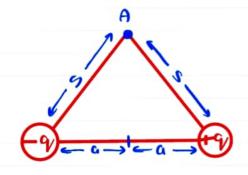

$$V_{Net} = V_{+q} + V_{-q} = \frac{1}{4\pi\epsilon} \frac{+q}{(\pi-q)} + \frac{1}{4\pi\epsilon} \frac{-q}{(\pi+q)}$$

$$V_{Net} = \frac{1}{4\pi\epsilon} c_{V} \left(\frac{1}{24-\alpha} - \frac{1}{24+\alpha} \right) = \frac{1}{4\pi\epsilon} c_{V} \left(\frac{(\pi+q) - (\pi-q)}{(\pi-q)(\pi+\alpha)} \right)$$

$$V_{Net} = \frac{1}{4\pi\epsilon} c_{V} \left(\frac{\frac{24+q-24+q}{24-q^2}}{(\frac{24^2-q^2}{2})} \right) = \frac{1}{4\pi\epsilon} c_{V} \left(\frac{2c}{\pi^2-c^2} \right)$$

$$V_{Net} = \frac{1}{4\pi\epsilon} \left(\frac{c_{V} \times 2a}{4^2-c^2} \right)$$

Potential at equationial Point

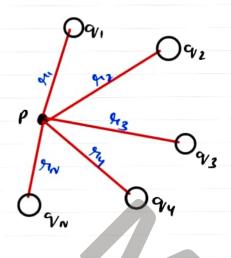

Potential at Point A is given by

$$V_{NC+} = V_{+q} + V_{-q}$$

$$= \left(\frac{1}{4\pi E} + \frac{1}{5}\right) + \left(\frac{1}{4\pi E} - \frac{1}{5}\right)$$
 $V_{NC+} = \frac{1}{4\pi E} \left(\frac{1}{5} - \frac{1}{5}\right)$
 $V_{NC+} = \frac{1}{4\pi E} \left(\frac{1}{5}\right) = 0$
 $V_{NC+} = 0$

So Potential at equationial point is 2010.

Electric hotential due to a system of charges

We need to find Potential at Point P ave to N changes.

We know potential due to a point charge is $V = \frac{1}{4\pi\epsilon} \frac{Q}{2\pi}$ Similarly for Point P:- $V_1 = \frac{1}{4\pi\epsilon_0} \frac{QV_1}{2\pi_1} \quad V_2 = \frac{1}{4\pi\epsilon_0} \frac{QV_2}{2\pi_2}$ $V_3 = \frac{1}{4\pi\epsilon_0} \frac{c_{V3}}{2\pi_3}$ and so on for other charges

Total Rotential = $V_1 + V_2 + V_3 - - - V_N$ $V_{Net} = V_1 + V_2 + V_3 - - - V_N$ $V_{NC+} = \frac{1}{L_{ITE}} \frac{q_{V_1}}{r_{I_1}} + \frac{1}{L_{ITE}} \frac{q_{V_2}}{r_{I_2}} + - - - + \frac{1}{L_{ITE}} \frac{c_{V_N}}{r_{I_N}}$

VZ NOVI

Behavious of Conclustors in Electric field

1) Net electric field inside a Conductor is always eero

2) Just outside the Surgare of a charged (modulator, electric field is normal (lempendicular) to the surgare

51 electric field is not perpendicular then it will have a tringential Component along the surgare which will include Surgare current. But no such current exist. So electric field is normal to the Surgare.

3) Net change inside a conduction is always eero, any excess change always comes to the Surgare of the conductors.

y) Potential inside the Conductors & on the Surgare is always Contact.

we know $E = -\frac{dv}{ds}$ But inside Conductors E = 0de so $-\frac{dv}{ds} = 0$ or dv = 0after Integration v = constant

5) Electric field is zero in the (avity o) a hollow (andustrum

Relation 5/w electric field & Potential

Consider a charge of located cit point o. Let A B B be two points reported by distance du. Va= Potential at Point A = V VR = Potential at Point Bz V+dV Men Potential difference VB-VAZ V+dV-V = dV - 1 How, Funce applied on Test change (40) F = -que (minus because force & Electric field one Sphosite) Now work = force x displacement W = Fdx W = - q & dx - (2) Also from definition of potential difference w= 90 (vB-VA) w= 90 dv (: from en 0) equating eqn (1) p (2) - que Eder = quo du Hegative sign Indicates that the electric field is always points towards the decreasing Potential.

Equipotential Surgare

A Surgare that has some potential at every point on it is called equipotential surgare.

Puoperties:

1) No work is done in moving a charge over on equipotential surjoine we know $V_B - V_A = W$ But at equipotential surjoine $V_A = V_B$

Thus $\underline{w} = Vg - Vg = 0$

So w= 0

2) Electric field is always perpendicular to the equipotential Surface.

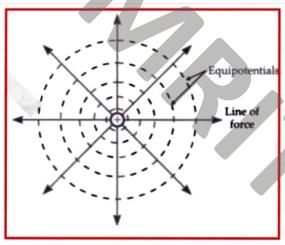

WE FS (OSB

As w=0 for moving change at equipotential surface

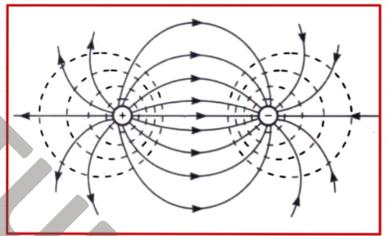

- 3) Equipotential surgare use closer together in regions of strong field & forther apart in the regions of weak field.
- 4) No two equipotential surgare con intersect each other.

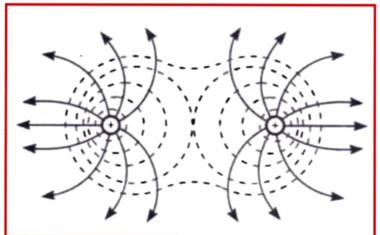

Equipotential surface

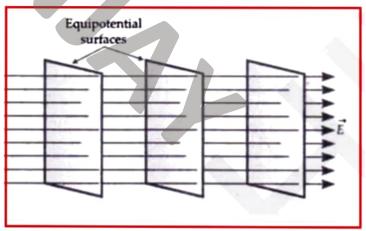

Point charge

Equipotential Surface due to a dipole

Equipotential Susyone due to Same type of charges

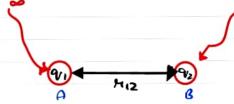

Equipotential surjone due to Uniform electric field

Putential energy due to a system of two charges

W= WORK clone to bring q, from infinity to point A

W=0 (: Because no electric field is present)

w2 = work done to bring 9/2 from infinity to point 3:-

W2 = V1 9/2

here v, z Potential due to charge qui

W2 = 1 91 4/2

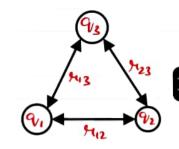

Total WOME 2 W, + W2

This work is converted into Potential energy

FON a system of 3 changes, Potential energy is

U= 1 Sure + Grays + Grays + Grays

The first

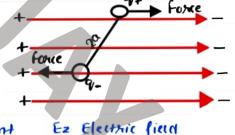

Potential energy of a dipole in electric field

when a dipole is kept imide a uniform electric field, it experience a equal funce in upposite directions as shown in figure. Thus Net funce = 0

We know T= PESIND

where Pz dipole moment Ez Electric field

Now using :-

WONK z Tonque x Angular displacement

FUR small displacement do, work will be dw . so

dw 2 T x do

dw = $\rho \in Sin0$ d0

Antegrating som Siden: $\int_{0}^{\omega} d\omega = \int_{0}^{0} \rho \in Sin0$ d0 $\left[\omega\right]_{0}^{\omega} = \rho \in \left[-(0s0)\right]_{0}^{0} = -\rho \in \left[-(0s0)\right]_{0}^{0}$

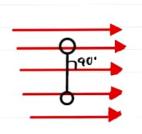

$$[\omega-0] = -\rho \in \left\{ (0s\theta_2 - (0s\theta_1)) \right\}$$

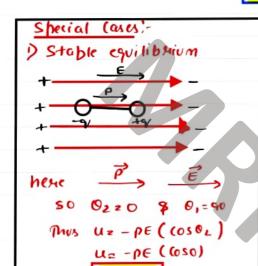

$$\omega = -\rho \in \left\{ (0s\theta_2 - (0s\theta_1)) \right\}$$

This work is converted into Potential energy Uz - PE[(0502 - (050,))

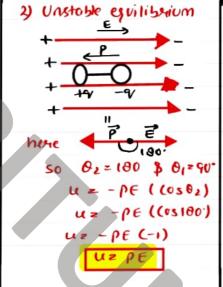

Now Let initially dipole is kept perpendicular to the electric field.

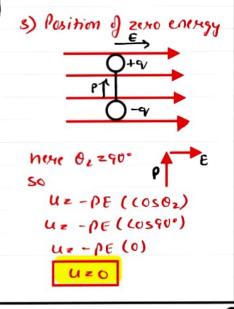

Then $0_1 = 90^{\circ}$ $u = -\rho \in \int (0.50_2 - (0.590)) = -\rho \in \int (0.592 - 0.590)$ $u = -\rho \in \int (0.50_2 - 0.590)$

u=-PE

(aparitance

The electrical (aparitance of a conductor is the capacity to hold electrical charge

Copacitance = Change Potential

ᆽ

 $C = \frac{Q}{V}$

02

(aparitance depends on)-

- 1) Size & shape of the Conductors
- 2) Nature of surrounding medium
- 3) Priesence of other Conductors near it.

SI unit of (apacitance is famon (f)

Parallel prate Copacitor

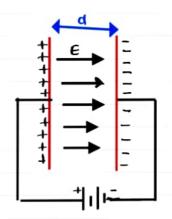

det Az Amea of plate

dz clistance blw plotes

Tz Sunjace change clessity

O z change on each plate

Now Capalitanie = Charge
Potential

Also,

Put 2,8 in () egn:

So Coporitance depends upon: 1) Asso of plate

- 2) Permittivity of me medium
- 3) distance 51w Motes

Capacitance in Sexues

when conocitous are auranged in Series, charge on earn capacitor

But Potential of each capacitor is different (V, almoss (1), (V2 conoss (2) \$ (V3 annoss (3)

is some = Q

Now using formula (= Q/V for Conscitance 4:-

for copositance a

Total potential Une+ = VI+Vz+V3

$$\frac{Q}{Q} = \frac{Q}{Q} + \frac{Q}{Q} + \frac{Q}{Q}$$

Capacitous in parallel

When Capacitures care consumped in parallel voltage across each capacitus is some But change stored on each conacitor is different (Q, inc,), (Qz in (2) & (O3 in (3)

Now using formule C= 0

for Capacitance (:- for Capacitance C:-

Cliz CV

(2 z 02

for Capacitance (3: C3 = 03

$$(2 \ge \frac{0}{V})$$

Qz = QV

Total charge, Onet = 01+0,+03 CNET V Z (IV + CZV+ GV

CHE+ = C+ C+ C

net electric field is zono.

Energy stored in a capacitor (No Perivation, only formula in Syllabus)

Energy stored, $U = \frac{1}{2} (v^2)$ or $u = \frac{1}{2} \frac{Q^2}{C}$ or $u = \frac{1}{2} Qv$

Benaviour of Conductors in external field

When a Conclusion is placed inside an external electric field , the free electrum priesent inside the Constitute starts durifting towards the positive plate & the hositive ions of the conductor starts moving towards me negative plate. Due to which The electric field is set up inside the Conductors (Ei) This priviless continues till the internal electric field is equal to the external field. Now the two electric field (External field & internal electric field) Becomes equal inside the conductor. Thus Conductor No Hectric field

Thus Enex = Eo- Ei ENet = 0

Behaviour of dielathic (Gasulatur) in external elathic field

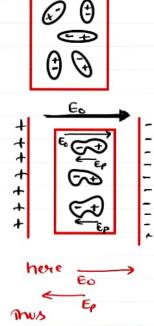

A cliefecturic is a type of gosvlotour which closmot have force electurous but have holan un non notan moterales which can be holanised in external electure field.

When a dielectric is placed inside the external field the dipole present inside the dielectric starts hotating in such a way, that -ve part of dipole points towards positive place & the part of dipole points towards negative place.

Due to the shifting of clipole, a small electric field is known clivelops inside the cliefectric. This electric field is known as Polanised Electric field (Ep). However this electric field is never able to Completely Contel out the external electric field.

Thus net electric field inside the dielectric

Eiz Eo-Ep

Ei = Eo-Ep

Dielectric Constant

Me section of extension electric field (60) to the Meduced electric field (9 mide Dielectric) is collected Clicketric Company (4) or sulphing permittivity.

 $\begin{array}{c|c}
 & \overline{E_0} & \overline{E_0} \\
\hline
\hline
E_1 & \overline{E_0} & \overline{E_0} \\
\hline
\end{array}$

Parallel plate Capacitor with dielectric

det A = Assea of plate
